

COMP7710

Programming Fundamentals

Today's lecture
Course Overview

Course Convenor
Bernardo Pereira Nunes

Australian
National
University

All lectures are recorded and made available on Canvas

I acknowledge and celebrate the First Australians on whose traditional lands we meet, and pay our respect to the elders past and present.

Challenge #1

Write a Java program that:

- > asks the user for their name
- > asks for their year of birth
- >> prints a personalised message with their approximate age

*you may use any tools you like (including GenAI)

Lesson learned #1

I can generate code.

They can generate code too

Challenge #2

```
public class Main {  
    public static void main(String[] args) {  
        int total = 0;  
  
        for (int i = 1; i <= 5; i++);  
        {  
            total += i;  
        }  
  
        IO.println("Total: " + total);  
    }  
}
```

Lesson learned #2

But I cannot reason about code.

Small code.

Simple idea.

Subtle mistake.

Big conceptual lesson.

Programming is not about guessing syntax.

It is about building structured knowledge step by step.

Challenge #3

The Consistency Experiment (*programming yourself* 😊)

- > Attend every lecture for the next 4 weeks.
- > During each lecture:
 - >> take handwritten or structured notes
 - >> write down one concept you did not fully understand (search, use the forum, read)
 - >> spend 20 minutes after each lecture reviewing your notes

Lesson learned #3

Programming is not hard because syntax is hard.

Programming is hard because:

- > it requires cumulative knowledge
- > concepts stack
- > missing Week 2 makes Week 5 harder

Discipline, engagement, repetition, knowledge reinforcement are far stronger predictors of success in programming than “talent”

Many students think programming is about brilliance.
It is not. It is about consistency.

Challenges and Opportunities Posed by ChatGPT on Introductory Programming Courses

Marika Tani (marika.tani@anu.edu.au) | Supervisor: Dr. Bernardo Pereira Nunes

Motivation

Since ChatGPT was launched last November, many educators hold their concerns about students' **academic dishonesty problems**. ChatGPT has already demonstrated its extraordinary performance by passing one of the MBA exams and medical school exams^[1]. However, the **AI tool brings not only negative aspects**, but also positive aspects associated with their use in education.

Research Objectives

1. Understand both challenges and opportunities brought in by ChatGPT in Computer Science education.
2. Understand the role of assessment design to address the challenges and opportunities posed by ChatGPT.

Literature Reviews

- Bloom taxonomy
- The 12 assessment types
- Academic dishonesty

Methods

1. Map the revised Bloom taxonomy and the 12 different computer science question types^[2] using experts in the field
2. Assess ChatGPT (GPT-4) solutions for first- and second-year programming courses: Structured Programming, Software Construction, and Software Engineering
3. Analysis of Performance of ChatGPT

Example Questions

Understand

Create

Apply

Results

Discussions

1. Should we prohibit the usage of ChatGPT in education? (**)
2. Does ChatGPT deprive students' learnings?
3. Does ChatGPT bring the positive elements for students' learnings?
4. How ChatGPT affect our assessments' design in computer science courses in the future?

COMP8755 – Project Work in Computing
Australian National University | May 19th, 2023

Type of Questions – The Case of Computer Science

Noa RAGONIS

School of Education, Computer Science Department, Beit Berl College

Department of Education in Technology and Science

Technion – Israel Institute of Technology, Israel

e-mail: noarag@beitberl.ac.il

Abstract. In this paper, I explore and discuss the variety of types of questions that can be used by computer science educators in different teaching situations and processes: in classroom lessons, in the computer lab, as homework, or in tests. The use of various types of questions offers many advantages, both for learners and for the teaching process. Twelve different types of question are discussed. Each is presented by its classification title, a short description of the specific type of question, a concrete example or an example pattern, and a short pedagogical discussion that includes remarks on cognitive aspects. Three general types of questions are presented and discussed: combination questions, narrative questions, and closed questions. These types of questions relate to "programming-like" assignments since they are the most common subject encountered in the teaching of computer science (Java is used as the implementation language). However, as discussed here in brief, most of the question types are also suitable for most other contents in the teaching of computer science.

Key words: computer and information science education, algorithms, human factors, types of questions, cognition in computer science, problem solving.

Bloom's Taxonomy

Let's take a break from talking about
GenAI and focus on this course
(and how to absolutely ace it!)

Welcome to COMP7710!

Agenda

- > Intro to COMP7710
- > Assessments
- > Badges
- > Rules and Services
- > Class Representatives

ABOUT ME

Dr Bernardo Pereira Nunes

bernardo.nunes@anu.edu.au

after many years...

Computer Engineer, PUC-Rio

MSc in Informatics (Databases), PUC-Rio

PhD in Informatics (Databases), PUC-Rio / L3S Research Centre

Adjunct Professor at the Dept of Informatics, PUC-Rio

Collab Prof. at the Dept of Applied Informatics, UNIRIO

Senior Lecturer at CECC > CSS, ANU

Sub-Dean (Academic Integrity) at CECC, ANU

Sub-Dean (Educational Programs) at CECC/CSS, ANU

Sub-Dean (Student Experience) at CSS, ANU

Associate Dean (Student Experience) at CSS, ANU

Research Interests: Semantic Web, **Computers in Education**, Information Retrieval and **Web Science**

Canberra, Australia

Break the Ice

Your turn to let us know a little bit about you!

Hi, I am ... and I love COMP7710!

Share your hobby!

Talk about your interests!

Fun fact about you!

The COMP7710 Team | Join us on EdStem

Bor Nunes
is completely fine!

*Java is easier
than my name 😊*

*Cathy, Keshav, Rishi, Greg, Victoria, Hao Ye,
Mukul, Nanxuang, Tanisha, Yichen, Zane Gates,
Wenyu Dai, Minh Hien Bui*

ABOUT THE COURSE

In-person attendance – besides me, who else is coming?

Learning in this course

- > Maximise your learning by attending face-to-face
- > Engaging and collaborating with your peers is vital
- > We value *your* opinions and viewpoints
- > Participation during classes enables you to learn from others
- > Feedback is welcome at the end of every session
- > Recordings supplement your learning

Benefits of in-person attendance

- > Real-time whole class interaction
- > Collaborative learning: learn from both the lecturer and other students
- > Ask questions in real time to clarify your understanding and get immediate responses
- > Your lecturer can see when you don't understand and can explain a concept in a different way
- > Build new relationships and gain a sense of belonging
- > Improves language and communication skills
- > Diverse team environment encourages critical thinking
- > Network, connect with, and problem-solve with your peers and educators

- > What do you think would encourage your colleagues (not you, since you're already here) to attend classes in person?
- > Why would you stop attending classes?

Uni professor when he checks the attendance sheet and it has 80 signatures but there are only 35 students

Learning Path

*This is only a representation;
official tentative schedule is on Canvas*

Delivery Mode

In-person | Dunbar Lecture Theatre, Physics, Bldg 39A

Live | Recorded Lectures

Meeting ID: 66 0100 0010

Password: Ilovecomp

Labs are in-person | check on MyTimetable

Canvas | <https://canvas.anu.edu.au/courses/8580>

Lecture A

Every Week on Monday 5
PM – 7 PM

Lecture B

Every Week on Thursday 9
AM – 11 AM

Online Discussion | EdSTEM

- > Discussion forum is hosted on EdSTEM
- > Use the forum to ask about questions related to the labs, lectures and the course
- > Tutors and instructors will respond to the Ed discussion forum regularly
- > **Personal requests** should be made as **private posts**
- > **Appeals** should be submitted as **private posts** each assignment (instructions will be provided on Ed)
- > **Be nice and kind to everyone** 😊

What is the course about?

- > The course focuses on key aspects of **solving programming problems**: reasoning about a problem description to **design appropriate data representations and function/method descriptions**, to find examples, to write, test, debug, and otherwise evaluate the relevant code, and to present and defend their approach.
- > You will learn to effectively use **a large standard library** and **key standard data structures, including lists, trees, hash tables, and graphs**. The course also introduces the basics of reasoning about the time and space complexity of algorithms, in particular as related to the above data structures.
- > The course uses Java, Git, Markdown, JavaDoc, JShell, and IntelliJ.

Prerequisites

- > You are not able to enrol in this course if you have previously completed or are currently enrolled in [COMP1110](#) OR [COMP1140](#) OR [COMP6710](#) OR if you are enrolled in the Master of Computing (Advanced).
- > You will need to contact the Student Services to request a permission code to enrol in this course.
- > A student says, “my case is different”. I agree, but you still need to follow the recommendation above.
- > Sorry, I do not issue permission codes.

**COMP1110, COMP1140, COMP6710
ARE NOT THE SAME AS COMP7710**

ABOUT THE ASSESSMENTS

Assessment

Assessments	Weight
Lab Assignments	8%
List of Exercises	10%
Code Walk	2%
The Open Java Book Student Edition	10%
Mid-term Test (I and II)	30%
Final Exam	40%

***Probably the most important information on this slide: no hurdles**

Lab Assignments

- > Use MyTimetable to enroll in the most suitable lab session available
- > Each lab runs for two hours and contain tasks that must be completed individually
- >> *No labs in weeks 1, 5 (Test I), 9 (Test II) and 12*
- >> *Drop-in sessions in Week 5 and Week 9*
- > Labs are *in-person* (non-mandatory but **strongly recommended**)
- > Labs contain **practical programming tasks (very useful for the entire course and life)**
- > Ask your tutor for help and collaborate with your colleagues
 - . Marks are awarded based on attempts rather than correctness
 - . Submission is required to receive marks, regardless of correctness
 - . Must be submitted before the deadline to receive marks

- > Lab tasks carry **8% of the total marks | Submission via GitLab (except in week 2)**
- > **Week 2 (Onboarding Lab) – You must attend and complete the tasks of this lab to receive marks. Your tutor will verify completion of the lab.**

Code Walks

A code walk is a common practice in Computing where developers explain their code to others.

- > During lab sessions, **your tutor may approach you to conduct a code walk.**
- > Each student is required to participate in **one code walk during the course.** Code walks are conducted during the scheduled lab sessions, where a tutor will randomly* select a small number of students to discuss their code. During the code walk, students must explain their implementation and demonstrate their understanding of the programming concepts used and design decisions.
- > The code walk is a formative assessment, and **marking is attempt-based** rather than based on correctness. It provides students with an opportunity to receive direct feedback from tutors and to practice articulating their understanding of programming concepts.
- > The code walk is worth **2% of the total course mark.**

*You must ensure you complete your code walk. You may speak with your tutor to arrange it in any lab session; otherwise, tutors may randomly approach students during labs.

List of Exercises

- > 10 list of exercises released as course progresses (weekly)
- > Each list of exercises consists of approximately 5-10 programming questions
- > The exercises form a formative assessment designed to support practice and consolidation of key concepts
- > Students may complete the exercises individually or collaboratively
- > Assessment is attempt-based (**individual submission counts as completion**), rather than based on the correctness of the final solutions.

- > Ask your tutor for help and collaborate with your colleagues
 - . Marks are awarded based on attempts rather than correctness
 - . Submission is required to receive marks, regardless of correctness
 - . Must be submitted before the deadline to receive marks

- > The lists of exercises carry **10% of the total marks** | **Submission via GitLab**

The Open Java Book | Student Edition

> The book assignment is a group-based assessment where each group will write a chapter of the book. A predefined list of topics will be provided. **Groups will select one topic from the list on a first-come, first-served basis. Book will be made available online with a DOI.**

The chapter (**max 2,000 words** excluding exercises, solutions and JavaDoc) must include:

- >> An explanation of the core conceptual topic
- >> A relevant use case illustrating practical application
- >> A set of three exercises related to the topic
- >> A list of potential solutions for the exercises
- >> JavaDoc is mandatory for all code

*Note that submissions that **exceed the prescribed length will incur a penalty of 1 mark per 10%** (or part thereof) beyond the specified limit, up to a maximum of the total mark.

*All content must be original and created by the authors (students). **A list of individual contributions must be listed in each chapter.** This is a summative assessment and marked based on correctness of the concepts, use case, exercises, solutions and JavaDoc.

What do students ^{nicely say} ~~complain~~ about group assignments?

- > *“It was a pain working in a team. Everyone has their own priorities, and most of them leave the work up to the final week, which leaves us with insufficient time for testing.”*
- > *“I found it interesting to be put in a project manager role. It was a lot more stressful than I expected. It definitely reminded me of why I dislike group assignments, I felt a lot that I could get things done faster if I was not constantly trying to coordinate everyone.”*
- > *“We underestimated the difficulty of the project, and the time allocated to each part of the project was a bit wrong.”*

My suggestion: interview potential teammates. Friendship does not always translate into effective teamwork.

#IHateGroupAssignments #COMP7710

What do students nicely say about group assignments?

- > *"I really enjoyed the process ... I think it's a really good assignment concept that teaches students a lot. I personally gained a lot of new skills..."*
- > *"By far, this has been one of the most enjoyable projects."*
- > *"Overall, this is a fantastic groupwork and I have learnt really much this time!"*
- > *"The knowledge I've gained from working on this project is priceless and will help me when I work on new projects in the future."*
- > *"I am really satisfied and proud of what I have done in this project."*

*...whether good or bad, the experience is important for your future.
Programming is a collaborative activity, and gaining this experience now is
valuable for your future.*

My suggestion: Do not leave to the last minute.

#ILoveGroupAssignments #COMP7710

Practice is important!

The more you practice, the luckier you get.

Karate Kid (1984) | A thousand days of practice for one day of performance

- > Complete all lab assignments and exercise lists
- > Form study groups to practise together and support each other in understanding concepts and exercises

Mid-term Tests

- > The mid-term tests are summative assessments in which students must individually demonstrate their understanding of the course material.
- > Each mid-term test is conducted **during the scheduled lecture time** and is **paper-based**.
- > **No materials are permitted during the mid-term tests.**
- > Students are assessed on their ability to apply concepts independently under exam conditions.

- > There are two mid-term tests, and the lower of the two mid-term test marks will be automatically redeemed against the final exam.

- > Each mid-term test carries **15% of the total marks**
- > Week 5 and Week 9: Thursday at 9 AM
- > Duration: 1 hour (to be confirmed)

Final Exam

- > The final exam is a summative, individual, and **computer-based assessment** in which students must demonstrate their understanding and application of the concepts covered throughout the course.
- > The exam will be **conducted in the computer labs**, and students will use IntelliJ IDEA, Java and Git.
- > The final exam may include a combination of **coding tasks, multiple-choice questions, and open-ended questions**.
- > The duration of the final exam is **180 minutes**.
- > You may bring one cheat sheet.
- > Further specifications will be provided prior to the exam via the Ed forum.
- > **Final exam carries 40% of the total mark**

How are programming tasks marked?

- > Many examinable items will be evaluated by an **auto-marker** and are subject to **hand-testing**.
- > There will be **open test cases**; and, **not revealed test cases** to check the correctness of your code.
- > **Late submission** of assessment tasks without an extension are penalised at the rate of 5% of the possible marks available per working day or part thereof. Late submission of assessment tasks is not accepted after 10 working days after the due date, or on or after the date specified in the course outline for the return of the assessment item.

Use of Gen AI

- > GenAI tools are excellent for learning, but you must be aware of the **illusion of mastery**.
- > The use of GenAI tools are **allowed in formative assessments**.
 - >> Proper citation and prompts must be provided, along with a description of how the tool contributed to the assignment.
 - >> Marks will reflect your contribution rather than the contribution of the tools.
- > **GenAI tools are not allowed in Mid-term tests and Final Exam**. You will not have access to these tools during the tests and final exam.
- > Also, **the content created for the book assignment must be original and authored by students**. The use of GenAI is allowed for grammar checking only. A statement confirming that the chapter content is original and authored exclusively by your group is required.

ADDITIONAL ACTIVITIES

Use of Gen AI

> Feedback Session (drop-in sessions)

- >> runs weekly from Week 4 to Week 12
- >> provides support to help you understand feedback from auto marking and lab exercises
- >> offers guidance on how to approach exercises and improve your solutions
- >> focuses on clarifying misunderstandings and strengthening problem solving strategies
- >> **optional** drop-in session designed to help you make steady progress

> Debugging Session

- >> runs three times per semester
- >> challenges you to identify, explain, and fix deliberate bugs in small Java programs
- >> encourages the use of IntelliJ tools (e.g., breakpoints, step execution, inspections) and GenAI tools,
- >> focuses on systematic debugging strategies, code comprehension, and stronger problem-solving skills
- >> **optional** participation; badges awarded, no marks attached

> Coding Challenge

- >> runs three times per semester
- >> includes a set of problems to be completed during the challenge session
- >> designed to test your understanding under time constraints
- >> encourages clear, correct, and efficient solutions
- >> **optional** participation; badges awarded, no marks attached

ABOUT THE BADGES

COMP7710 Badge System

+1 mark added to
the final exam

+1 mark added to
the overall course
mark

What is the (pedagogical) goal of the badges?

Engagement, reinforce positive behaviours and academic achievements, consistency and recognition 🧑🏫

What do I have to do to earn a badge?

Simple, just follow the rules! 🤖

The Completion-and-consistency Badge

Rules

- > Submit all lab activities on time
 - > Submit all exercise lists by Week 12 (Friday COB)
 - >> Note that the original deadline for the list of exercises is not Week 12. See deadline on Canvas.
- For the purpose of awarding the badge you must submit by Week 12.
- > Achieve at least 25/100 in the Book Assignment
 - > Achieve at least 25/100 in each mid-term test (after redeeming rules)
 - > Achieve at least 25/100 in the final exam

Reward

At the end of the course, you will automatically receive ONE extra mark (out of 100) in your final course mark if you are still eligible.

Quiz Master Badge

- > This badge rewards active participation and mastery during lectures
- > During the semester we will run online quizzes during the lectures
- > Top 3 (🥇🥈🥉) students receive a Quiz Badge
- > We will use a Kahoot! Game for the quizzes
- > Quiz badges are cumulative (students may earn more than one)

Reward

At the end of the course, you will automatically receive ONE extra mark (out of 100) in your final exam mark if you earned this badge

<https://kahoot.it>

ABOUT THE RULES AND SERVICES

EDUCATION ACCESS PLAN (EAP)

<https://www.anu.edu.au/students/accessibility>

Accessibility

Assisting students to participate fully in their program of study by minimising the impact of disability and disadvantage on learning.

New & Prospective Students

ANU is committed to providing equal opportunity for students with disabilities and ongoing health conditions through an inclusive educational environment. Here you find information about registration.

- [Prospective Students](#)
- [Inherent course requirements](#)
- [How to Register](#)
- [Eligibility](#)
- [Medical Documentation](#)
- [Confidentiality & privacy](#)

Related links

Business contacts

- [Accessibility](#)

If you have an EAP, please get in touch with me as soon as possible so we can discuss any necessary adjustments.

ACADEMIC INTEGRITY

GENERAL INFORMATION

Academic Integrity is taken seriously at ANU!

The [Academic Integrity Rule 2021](#) (Rule) is a legal document that the University uses to promote academic integrity, and manage breaches of the academic integrity principle.

[Click here](#) to learn more about the academic integrity rules.

All students are expected, both individually and collectively and to the best of their ability, to advance the pursuit, dissemination and application of knowledge ethically, and by behaving honestly and responsibly, and with respect and fairness, in scholarly practice.

The **academic integrity principle** is the principle that every student of the University:

- (a) is committed to engaging in academic work in ways that are consistent with, and actively support, academic integrity; and
- (b) upholds this commitment by behaving honestly, responsibly and ethically, and with respect and fairness, in scholarly practice.

ACADEMIC INTEGRITY

GENERAL INFORMATION

We are all responsible for maintaining a culture of Academic Integrity at ANU.

We have an obligation to be informed of and to understand the requirements of academic integrity and the academic integrity principle. **Being uninformed of or misunderstanding the requirements of academic integrity will never be an excuse for a breach of academic integrity.**

How do I know about the Academic Integrity Rules?

As a student, you are expected to undertake the online **Academic Integrity module** before submitting your first piece of assessment. These modules will guide you to a successful academic journey with integrity.

A culture of Academic Integrity starts with you. How to report and foster academic integrity?

We cannot ignore situations in which we have any evidence that someone has breached academic integrity, and must deal with the situation in an appropriate way as stated in the Student Code of Conduct (item 11, reporting). **Contact your course convenor, the teaching staff or the Sub Dean (Academic Integrity).** If you need further assistance, please contact education.css@anu.edu.au. Your identity will be kept confidential.

ACADEMIC INTEGRITY

while (integrity) knowledge++;

How do I acknowledge other people's work in my code?

Include in comments next to the code you reuse, the URL, author and date you extracted the code, and a brief explanation of whether you adapted the code or used it as-is (see real-world examples below).

Example 1

In describing the class *PluginProxyUtil* in the Apache Project source code, the developer cites the source as a post in a forum and includes the URL, author and date. Don't forget to indicate whether or not you modified the code (be clear and explain the changes in the comments).

```
/**
 * A utility class that gives applets the ability to detect proxy host settings.
 * This was adapted from a post from Chris Forster on 20030227 to a Sun Java forum here:
 * http://forum.java.sun.com/thread.jspa?threadID=364342&tstart=120
 * [...]
 */
```

Example 2

In the function *OutputTraceToStream* in the Google Chrome *stack_trace_win* source code, the developer cites the source code as the Microsoft Developer Network and includes a URL:

```
// Code adapted from MSDN example:
// http://msdn.microsoft.com/en-us/library/ms680578\(VS.85\).aspx
```

Note that when you use code from an open-source project, you need both to attribute the source and follow the terms of any open-source license that applies to the code you are using.

ACADEMIC INTEGRITY

while (integrity) knowledge++;

Contract Cheating

Contract Cheating is submission of an academic output that is prepared or drafted in part or in full by a person who is not acknowledged in the output as an author or co-author of the output; both the person writing the output and the person submitting the output are guilty of Contract Cheating.

Contract cheating is so serious that **it may result in criminal prosecution** under Australian Commonwealth Government legislation.

No matter how much pressure you are under, engaging in this is far worse than failure to submit an assignment.

Examples

"I used a solution created by an online tutoring company. I thought it was ok."

[Contract Cheating]

"I bought notes and tutorial answers from a friend who has taken this course before."

[Contract Cheating]

"I used a social network to find someone and paid them to do the assignment for me"

[Contract Cheating]

**Note that the examples are not intended to be comprehensive but rather illustrative of common breaches of academic integrity.*

ACADEMIC INTEGRITY

while (integrity) knowledge++;

The Use of Generative AI Tools

Generative AI tools (e.g. ChatGPT, Co-Pilot) are computer programs that use machine learning algorithms to generate new and original data or content. They can be used to generate text, images, music, or videos that are not explicitly programmed but are learned from a large dataset of examples.

→ OpenAI. (2023, February 16). What are Generative AI tools? [Response to a question]. Retrieved from <https://github.com/openai/gpt>

Can I use Generative AI Tools?*

- > Use of generative AI tools is allowed unless expressly prohibited in the Class Summary/Canvas and Assignment Sheet.
- > You must acknowledge, provide the prompt(s) and cite the use of any Generative AI tools in your work.
- > Uncited use of generative AI tools is considered a potential breach of the Academic Integrity Rules.

Examples

"I used a generative AI tool and acknowledged it in my report. The assignment sheet mentioned that it was not allowed, but I missed that part."

[NOT OK]

"I did not properly cite the parts of my work where I used Generative AI tools."

[NOT OK]

"I acknowledged and cited all parts of the assignment where I used generative AI tools, including my prompts. The class summary and assignment sheet did not mention it was not allowed." [OK]

**Note that the examples are not intended to be comprehensive but rather illustrative of common breaches of academic integrity.*

SUPPORT TO STUDENTS

ABOUT HOW TO ENHANCE OUR EXPERIENCE IN COMP7710

Student Experience of Learning and Teaching (SELT)

Feedback is not just collected; it is reflected upon, discussed, and used to improve your experience

How feedback informs this course

- Refinements to assessment design, structure, and timing
- Clarifications to expectations, marking criteria, and learning outcomes
- Enhancements to learning resources, teaching activities, and student support

What changed based on feedback from previous semesters

- *Lecture styles/recording, code walks, assessments, functional Java, extensions, ...*

Ongoing Feedback

- *Students do not need to wait until the end of the semester to provide feedback. You may contact the course reps, course convenor, college reps, ANUSA, the Associate Dean (Student Experience), or the Associate Dean (Education).*

Student Experience of Learning and Teaching Survey

We encourage you to complete the end-of-semester survey to share what worked well in the course and to let us know where we can improve. Your feedback is valued and helps shape future offerings.

CSS CLASS REPRESENTATIVES

- > Class Student Representation is an important component of the teaching and learning quality assurance and quality improvement processes within the ANU College of Systems & Society (CSS).
- > The role of Class Representatives is to **provide ongoing constructive feedback on behalf of the student cohort to Course Conveners and to Associate Directors (Education) for continuous improvements to the course.**

Roles and responsibilities:

- > Act as the official liaison between your peers and convener.
- > Be creative, available and proactive in gathering feedback from your classmates.
- > Attend regular meetings, and provide reports on course feedback to your course convener
- > Close the feedback loop by reporting back to the class the outcomes of your meetings.

CSS CLASS REPRESENTATIVES

- > **Ensure students have a voice** to their course convener, lecturer, tutors, and College.
- > **Develop skills** sought by employers, including interpersonal, dispute resolution, leadership and communication skills.
- > Become empowered. **Play an active role in determining the direction of your education.**
- > Become more aware of issues influencing your University and current issues in higher education.
- > Course design and delivery. **Help shape the delivery** of your current courses as well as future improvements for following years.

Note: Class representatives will need to be comfortable with their contact details being made available via Canvas to all students in the class.

For more information regarding roles and responsibilities, contact: ANUSA CSS representatives

QUESTIONS?

MEME

Do not worry if you do not understand it now.

Come back to this meme later in the course and I am sure you will laugh.

Thank you
